AETERNAM BLOCKCHAIN CLUSTER GENESIS: INITIAL COIN OFFERING (ICO)

By: Ted Coombs (ceo@sempervitam.com) and Semper Vitam, Inc.

Aeternam Blockchain is a fork of Ethereum project with a secondary genesis block produced by forking the Venture Currency Blockchain's genesis block. Aeternam's native currency is used as gas to pay for Ethereum Virtual Machine bytecode execution on *Aeternam Virtual Machine*.

The Aeternam Blockchain project is growing around a group of like-minded people who desire a longer, richer, and healthier life and believe that **cryptoeconomics** is an important part of a new form of active social participation essential to brain health. Our growing community supports this group mindset by creating or sharing knowledge to support longer, healthier, more fulfilling lives.

Aeternam Blockchain enables cryptoeconomic value transfers and smart contract programming. Any Ethereum-compatible smart contract is binary-compatible with the **Aeternam VM** and works unchanged as an *Aeternam Blockchain smart contract*. Developers can even use the Remix online solidity compiler to prepare bytecode for publishing to the new **Aeternam Blockchain**.

As in all Ethereum Virtual Machines, smart contracts in Aeternam Blockchain may "own" other contracts, or possess native currency, fungible ERC20 tokens or non-fungible ERC223 tokens.

Purchase Genesis Wallets now to use smart contract bytecode after a Genesis Block is mined!

YOU MUST SEND AN ETHEREUM WALLET ADDRESS TO BUY AETERNAM NATIVE COIN.
PLEASE send a small payment first, for safety, then send an *Ethereum wallet address* plus transaction reference to include an *Ethereum wallet* address in the Aeternam Genesis Block.

Use any of the following **10 preferred cryptocurrencies** when sending ICO payments to me.
